Python Variable Practice

Practice using comments by putting a comment before each exercise.
Example: #Exercise 1: Printing a variable.

Exercise 1
Create program that initialises a variable called `apples`. Set the value of apples to 4.
Print the number of apples.

Exercise 2
Create a program that initialises a variable called `userName` and set it equal to Bob.
Print the userName.

Exercise 3:
Create a program that uses the `input` command to ask the user to enter their name.
Print the users name.

Exercise 4:
Expand Ex 3 to print a message to the user. For example if they entered Ann, it would print
Hello Ann.

Exercise 5:
Create a program that acts as a restaurant booking system.
Ask the user for their name, number of people and time they would like a reservation for.
The program should print a message to the user telling them their table is booked. The
message should look like this.

John has booked a table for 4 people at 8 o'clock
